

Ferrite Speaker rings

Great new feature

We are now able to offer Ceramic Ferrite loudspeaker rings with a chamfered internal diameter. This will alleviate the recurring problem of chipping of the magnet material as the drive coil is inserted, leading directly to failures caused by magnetic debris in the speaker assembly. Many international manufacturers have highlighted this as a potential production line problem that they wish to see addressed.

MMG MagDev Limited will be able to offer this feature in any ring size in the very near future. To our knowledge this feature is unique in the market place and will give us a major selling advantage.

In the first instance any interest in this development should be directed to: -
